- ## **V.25 bis Autodialer**

GENERAL

V.25 bis is an option that allows dialing functions to be controlled using synchronous data.

Select V.25 bis through the appropriate &M command in the AT command set (Chapter 5).

If using the LCD

 - Select SYNC DATA.
 - Scroll through the menu to Main Menu 5, MOD-IFY CONFIGURATION.
 - Advance to and enter the DTE PARAMETERS submenu.

Autodialer Command String and Parameters

Most command strings for the autodialer include two parts: the command itself and the parameter(s) that follow. For the purposes of this chapter, parameters can be telephone numbers or anything appropriate to V.25 bis as described in the following text. Parameters are separated by semicolons.

For example:

PRN a;nn...n where *a*=the phone number address in memory and *nn...n* = the phone number

The *a* and the *nn...n* are both parameters.

Not all commands have parameters. For example the CIC command has no parameter.

GUIDELINES

Use the following guidelines when working with V.25 bis software:

- An indicator enclosed in less than / greater than signs < > represents a specific character in the appropriate character set, ASCII or EBCDIC.

<sp> .. space

- Each response below is considered an individual message per V.25 bis conventions. A dial command with intermediate call progress enabled (sync mode ASCII/EBCDIC character set) is illustrated:

From DTE

<sy><sy><sb>CRN<sp>(205)555-0124<eb>

<sy><sy><sb>CNX<sp>@9600BPS<eb>

To DTE

INVPS

This message has one of three possible meanings:

- Any parameter set containing too many characters.
- Any parameter set ending with a semi-colon ;
- Any parameter set containing too many or not enough parameters; this includes
 - any command entered without parameters that requires parameters
 - any command entered with parameters that does not require parameters
- Spaces in a command from the DTE are optional and ignored.
- Command strings can be upper or lower case. Responses are always upper case.
- Only synchronous data formats are implemented. They include Bisync and SDLC (NRZ format) in ASCII or EBCDIC.
 - Any parameter set containing an out-of-range parameter

Invalid Responses Explanations

Except when stated otherwise, the following explanations for invalid INV responses apply:

INVNC Any transmission error (parity, framing, etc.).

INVMS Receiving too many characters for any command.

INVPS This message has one of three possible meanings:

This message has one of three possible meanings:

- Any parameter set containing invalid characters
- Any parameter or parameter set containing no valid (only ignored) characters
- Any parameter set containing an out-of-range parameter

**DIAL
PARAMETERS**

Table 7-1 lists and describes the parameters used in autodialing. The memory available for dialing can hold up to 40 characters. Parameters inserted for readability are not counted.

**Table 7-1
V.25 bis Dial Parameters**

Character	Function
0 thru 9	DTMF and pulse digit
*	and #
:	DTMF digit
:	Wait for dial tone
W	Wait for 2nd type of dial tone
>	Pause for 1 second
=	Pause for 3 seconds
<	Pause for programmed delay time
P	Pulse dialing
T	Tone dialing*
&	Flash (go on hook) for 1/2 ms
:	Return to command mode after dialing
Space, dash, parenthesis, period	Parameters inserted for readability

**V.25 bis
COMMAND AND
RESPONSE
DEFINITIONS**

The following sections describe the commands used with the V.25 bis autodialer and explain the responses received when each command is executed.

**Dial Command
CRN *nn...n***

The dial command is a CRN followed by the number to be dialed *nn...n*. The modem accepts up to 40 dial parameters, excluding the CRN command and any leading spaces.

Responses:

VAL Valid command received. Transmitted on receiving an error-free command with no

transmission error such as a parity error. This confirmation is sent before the command is executed.

INVCU Invalid command - command unknown.

Example: TRN (205)-555-0124

INVMS Invalid command - message syntax error.

Examples: CRN(205)-555-0124
CRN; (*semicolon invalid*)

INVPS Invalid command - parameter syntax error.

Examples: CRN (205)-555-0124
CRN (205)-555;0124
CRN

INVPV Invalid command - parameter value error.

Examples: CRN (205)-555-012Q
CRN - - -

CFIET Call failure - reorder or busy.

CFIRT Call failure - timeout occurred.

CFIDT Call failure - no dial tone.

INC Incoming ring detected.

**Program Number
Command
PRN *a; nn...n***

The program number command is PRN followed by the one digit decimal address *a* and the number to be stored *nn...n*. Each address can store up to 32 dial parameters. Ignored characters in the dial number are not stored. Nine stored numbers are available at addresses 1-9.

Responses:

Same as for the CRN command.

Intermediate Call Progress Responses

The following responses are given only if enabled.
Refer to the OPTIONS section later in this chapter.

CNX<sp>@nnnnBPS<sp>cccccc - where nnnn is the line speed and cccc is an identifier with a maximum of five characters, such as V.29. This connect response appears after handshake completed, but before DSR is activated. This response is required if the intermediate call progress option is enabled.

Dial Stored Number CRS a

The command for dialing a stored number is CRS followed by the one digit address a for the stored number to be dialed.

Responses:

Same as for the CRN command plus

CFINS Call failure - number not stored.

If the number is linked with other numbers, via a PRL command, failure responses are returned as

{sep}a;{call progress messages} ...

where a is the address dialed, followed by the separator field <eth><sy><sy><six> and call progress messages (CFI, etc.).

If the call fails to connect and the number is linked with other numbers, the autodialer tries to call the next number in the list of linked numbers.

The request list of stored numbers command is an RLN.

Responses:

INVCU Invalid command - command unknown.

Example: TLN

INVMS Invalid command - message syntax error.

Example: RLN;

If no number is stored at the specified address nothing is returned for that address. The separator {sep} is a

<eth><sy><sy><six>LSN <sp>

sequence for BISYNC format (the last LSN string terminates with <eth> per V.25 bis). For synchronous bit-oriented operation, each LSN string is treated as an individual message per V.25 bis.

All stored numbers are sent to the DTE as

LSN<sp>a;mn..n{sep}a;mn..n..

where a is the stored number address and mn..n is the number stored.

Disregard Incoming Call DIC

The command for disregarding an incoming call does not require parameters. If no call is incoming, the command is ignored.

Responses:

VAL Valid command received. Transmitted on receiving an error-free command with no transmission error such as a parity error. This confirmation is sent before the command is executed.

INVCU Invalid command - command unknown.

Example: TIC

INVMS Invalid command - message syntax error.

Example: SIC;

Connect Incoming Call CIC No parameters are required. If there is an incoming call, the modem immediately answers the call. If no call is incoming, the command is ignored.

Responses:

VAL Valid command received. Transmitted on receiving an error-free command with no transmission error such as a parity error. This confirmation is sent before the command is executed.

INVCU Invalid command - command unknown.

Example: TIC

INVMS Invalid command - message syntax error.

Example: SIC;

Radial Last Number CRR n

The CRR *n* command redials the last number a maximum of *n* times. If no parameters are present, the modem redials once. Also, the maximum number of redials, the amount of time between redials, and other parameters may vary depending on application and national requirements if outside the U. S.

Responses:

Same as for the CRS command.

Failure response is

{sep}r;{call progress messages}...

where *r* is the recall count ($1 \leq r \leq n$; 1,2,...etc.), followed by a separator field

<etb><sy><sy><stx>

and call progress messages (CFI XX, etc.). If the call fails to connect, this is repeated for the specified number of times.

Link Number by Address PRL a;b

This command links the number at address *a* with the number at address *b*. The addresses are one digit decimal values. Linking numbers enables different numbers to be dialed if a call failure occurs.

Only forward linking to one other number is allowed, so address 1 can be linked to 4 to 8 to 9 etc.; however (using this example), if address 4 is dialed by a CRS command without connection it links forward to 8 then to 9.

If all these fail to connect, the autodialer will not back-link to address 1 unless circular linking is used. Numbers may be linked as 4 to 5 to 3; however, if address 3 is dialed, back-linking to 5 is not allowed.

If circular linking (1 to 8 to 7 to 1) is used, dialing is discontinued after the addressed number in the dial command has been dialed twice. If only one parameter follows the PRL command, the number at address *a* is unlinked from its forward link.

For example, if the link list 4 to 8 to 3 to 7 to 9 to 1 exists and PRL 7 is received, 7 would be unlinked from 9, but not from 3. This would result in two link lists: 4 to 8 to 3 to 7 and 9 to 1.

Responses:

VAL Valid command received. Transmitted on receiving an error-free command with no transmission error such as a parity error.

This confirmation is sent before the command is executed.

INVCU Invalid command - command unknown.

Example: TRL 1;5

INVMS Invalid command - message syntax error.

Examples: PRL;1;5
PRL;

INVPS Invalid command - parameter syntax error.

Examples: PRL 1;5;
PRL 1;0;0
PRL 1;
PRL

PRL 001;5

INVPV Invalid command - parameter value error.

Examples: PRL 1;Q
PRL Q;1
PRL 1;45 where only

addresses 01 - 09 are defined

Request List of Version RLV

Responses:

INVCU Invalid command - command unknown.

Example: TLV

INVMS Invalid command - message syntax error.

Example: RLV;

LSV List version

The version information is sent to the DTE
as

LSV<sp>S362700:xxr01yyddr<sp>

where *xxr* is the code revision of the microcontroller PROM and *yyd* is the code revision. The *dd* is the model dash number and the *r* is the printed circuit board revision.

In all LSV examples, if no number is stored at the specified address no response is sent.

The separator field is an

<eth><sp><sp><stx>LSL<sp>

MODEM OPTIONS COMMAND

The program options command is PRO followed by the starting register address (1 to 3 decimal digits), option count (1 or 2 decimal digits) and the data for each option (1 to 3 decimal digits per option). Refer

The last LSL string ends with <etc> per V.25 bis. For synchronous bit oriented operation, each LSL string is treated as an individual message per V.25 bis. All linked numbers are sent to the DTE as

LSL<sp>a,l{sep}a;l

where *a* = stored address and *l* = link address.

to the OPTIONS section for available options with definitions, possible settings, and default values.

The modem must be able to accept 40 non-ignored characters besides the PRO command (leading zeros and semicolons are not considered ignored characters).

Responses:

VAL Valid command received. Transmitted on receiving an error-free command with no transmission error such as a parity error.

This confirmation is sent before the command is executed.

INVCU Invalid command - command unknown.

Example: TRO 0;1;1

INVMS Invalid command - message syntax error.

Examples: PRO;0;1;1
PRO;

INVPS Invalid command - parameter syntax error.

Examples: PRO 0;1;0;
PRO 0;1;1;i
PRO
PRO 0;001;1

INVPV Invalid command - parameter value error.

Examples: PRO 0;1;Q
PRO Q;1;1
PRO 0;0;0
PRO 68;1;0

when option 68 is undefined for the modem.

INVPV<sp>xxx Invalid command - parameter value error.

Examples: PRO 10;5;0;0;0;2;i

This invalid message can be returned when a block of options is being changed. The conditions for this invalid response are as follows:

- An undefined option number is specified. In the above example, if option 12 is undefined for a certain modem (and no other error conditions apply) options 10 and 11 would be changed as specified in the command message. The next option to be changed would be option 12. The modem would detect that this is an undefined option, stop execution of the command, and return an INVPV<sp>012 message. Options 10 and 11 would still be changed as commanded, options 13 and 14 would be unchanged.
- An out-of-range value for a particular option is specified. In the above example, if the fourth value in the option string is undefined or out-of-range for option 13 in a certain modem (and no other error conditions apply) options 10 through 12 would be changed as specified in the command message. The next option to be changed would be option 13. The modem would then detect that the value is undefined or out-of-range for that option, stop execution of the command, and return an INVPV<sp>013 message. Options 10 through 12 would still be changed as commanded; options 13 and 14 would be unchanged.

Save Current Settings	PRK saves option settings current.
PRK	Responses: VAL Valid command received. Transmitted on receiving an error-free command with no transmission error such as a parity error. This confirmation is sent before the command is executed.
INVCU	Invalid command - command unknown. Example: TRK
INVMS	Invalid command - message syntax error. Examples: PRP;1; PRP 001
INVPS	Invalid command - parameter syntax error. Examples: PRP 1; PRP 1;1
INVPV	Invalid command - parameter value error. Example: PRP 5
Restore Factory Settings	PRP <i>n</i> restores current option settings to factory option set <i>n</i> , where <i>n</i> is a 1 digit decimal number. PRP <i>n</i>
	<i>Note: Restoring a factory option set other than factory option 9 disables the V.25 synchronous dialer.</i>
Request List of Stored Options	RLO <i>xx,yy</i> The request list of stored options command is RLO followed by an optional 1 to 3 digit decimal address and a 1 or 2 digit decimal count. The OPTIONS section lists all available options with definitions, possible settings, and default values.
Responses:	INVCU Invalid command - command unknown. Example: TLO 0;1
VAL	Valid command received. Transmitted on receiving an error-free command with no transmission error such as a parity error. This confirmation is sent before the command is executed.
INVMS	Invalid command - message syntax error. Examples: RLO;0;1 RLO Q;1

INVPS Invalid command - parameter syntax error.
Examples: RLO 0;1;
 RLO 0;1;4
 RLO 0;001

INVPV Invalid command - parameter value error.

Examples: RLO 0;Q
 RLO 0;0
 RLO999;45

LSO List stored options.

The separator {sep} is a

<etb><sp><sp><stb>LSO<sp>

sequence for the sync format (the last LSO string terminates with <etb> per V.25 bis).

For synchronous bit oriented operation, each LSO string is treated as an individual message per V.25 bis.

If no parameters follow, all stored options are sent to the DTE as

LSO<sp>xxx;ooo{sep}xxx;ooo...

Each value must be padded with leading zeros so that each field has three characters. Option zero would be sent as

LSO<sp>000;000

If only an address follows the command, the single requested option is sent to the DTE as

LSO<sp>xxx;ooo

OPTIONS

The V.25 bis autodialer options can be changed using the PRO or the RLO command. The options are:
000 - 001: Not applicable

002: Intermediate call progress messages

- 0 - Disable
- 1 - Enable

Default value = 0

003: Blind dial

- 0 - Disable
- 1 - Enable

Default value = 0

004-006: Not applicable

007: Long space disconnect

- 0 - Disable
- 1 - Enable

Default value = 1

008-019: Not applicable

020: Programmable / Permissive operation

- 0 - Permissive
- 1 - Programmable

Default value = 0

021-022: Not applicable

023-049: Reserved for future use

If address and count follow the command, the requested count of options starting with the specified address are sent to the DTE as

LSO<sp>xxx;ooo{sep}xxx;ooo...

050:	Mode	0 - 2-wire dial-up operation (PSTN) 1 - 4-wire leased line operation 2 - 2-wire leased line operation Default value = 0	076:	Speaker control	0 - Off 1 - On 2 - N/A 3 - N/A 4 - On until CD 5 - N/A 6 - Off while dialing Default value = 4
051:	Primary transmit / receive rate (See Rate Select section below.)	Default value = 36 (9600 bps)	077:	Speaker volume	0 - Low 1 - Medium 2 - High Default value = 1
052-054:	Not applicable		078-084:	Not applicable	
055:	Transmit clock		085:	Constant carrier RTS/CTS delay	0 to 250 ms Must be set in increments of 10 ms: 10, 20, 30 ... 250 Default value = 0
	0 - Internal 1 - External 2 - Receive (slave)				
	Default value = 0				
056:	Leased line transmit level - Transmit level				
	(- (decimal) dBm)				
	Default value = 0				
057-062:	Not applicable				
063:	Autoanswer		086:	Not applicable	
	0 - Disable 1 - Enable (answer after 1 to 255 rings)		087:	DTR dropout timer	0 to 255 in 10 ms increments DTR must turn off for this length of time to be recognized. Default value = 5 (50 ms)
	Default value = 1				
064:	Line current disconnect				
	0 - Off 1 - Short (8 ms) 2 - Long (90 ms)		088:	Not applicable	
	Default value = 2		089:	Pause for comma in dial string	0 - invalid 1 to 255 seconds Default value = 2
065-075:	Not applicable				
090:	Carriage return character (13 decimal is ASCII and EBCDIC default)				

091:	Line feed character (10 decimal is ASCII default; 37 decimal is EBCDIC default)	104-106: Not applicable										
092:	Guard tone 0 = None 1 = 550 Hz 2 = 1800 Hz Default value = 0	107-899: Reserved for future use										
093:	Carrier detect delay 0 - Off 1 to 255 in increments of 10 ms Default value = 6 (60 ms)	900-902: Not applicable										
094:	Loss of carrier disconnect 0 - Off 1 to 255 in 100 ms increments Default value = 14 (1.4 sec)	903: Bilateral loop 0 - Disable 1 - Enable Default value = 0										
095:	DTR dial address Stored telephone number address to dial on DTR off-to-on transition Default value = 1	During a test bilateral loop is defined as follows: <table border="1"> <thead> <tr> <th>Test Commanded</th> <th>Bilateral Loop</th> </tr> </thead> <tbody> <tr> <td>Loop 1</td> <td>Loop 2</td> </tr> <tr> <td>Loop 2</td> <td>Loop 1</td> </tr> <tr> <td>Loop 3</td> <td>Loop 4</td> </tr> <tr> <td>Loop 4</td> <td>Loop 3</td> </tr> </tbody> </table>	Test Commanded	Bilateral Loop	Loop 1	Loop 2	Loop 2	Loop 1	Loop 3	Loop 4	Loop 4	Loop 3
Test Commanded	Bilateral Loop											
Loop 1	Loop 2											
Loop 2	Loop 1											
Loop 3	Loop 4											
Loop 4	Loop 3											
096:	DTR dial 0 - Disable 1 - Enable 2 - N/A Default value = 0	Loop definitions are per CCITT V.54.										
097:	Not applicable	904: DTE commanded remote digital loopback 0 - Disable 1 - Enable Default value = 0										
098:	Call timeout 0 - Off 1-255 sec Default value = 30 sec	905: DTE commanded local analog loopback 0 - Disable 1 - Enable Default value = 0										
099-102:	Not applicable	906: Remote commanded test 0 - Disable 1 - Enable Default value = 1										
103:	Signal quality retrain 0 - Disable 1 - Send training sequence on poor quality Default value = 1	907: Test timer 0 - Until DTR drops TTT - 1 to 255 sec Default value = 0										
		908: Not applicable
